Electronegativity

Definition:

Electronegativity is defined as the tendency of an atom to attract shared electron pairs in a chemical bond.

Key Explanation:

Electronegativity increases across a period from left to right due to increased effective nuclear charge. Fluorine has the highest value of 4.0.

Visual Snippet:

Source: Periodic_Notes.pdf (Page 1)

Example:

F is more electronegative than Cl

Important Points:

- Increases across a period from left to right
- Decreases down a group as atomic size increases

Study Intelligence & Dependencies:

- Completeness: 100% | Confidence: 8/10
